

Project Design Phase – Problem Solution Fit Template

Incident Lifecycle Automation using ServiceNow

1. Customer Segmentation

Customer Segment	Needs / Context
Employees / Incident Reporters	Need a simple way to report IT issues and receive timely support.
Service Desk Agents	Need to create, classify, assign and track incidents efficiently.
Level 2 Support Technicians	Need complete incident details, knowledge information and SLA visibility for investigation and resolution.
Service / IT Managers	Need visibility into incident progress, SLAs and related records.

2. Jobs to Be Done

- As a Service Desk agent, I need to create and classify an incident so that it can be routed to the appropriate support team.
- As a support technician, I need relevant knowledge and incident information so that I can investigate and resolve the issue.
- As a Level 2 technician, I need to see SLA and related-record information so that I can manage the incident within the required process.
- As a service team, I need to record causes and resolutions so that the resolution history is clear and reusable.
- As an IT support organization, I need related changes, child incidents and knowledge articles linked to incidents so that the complete lifecycle remains traceable.

3. Problem Root Cause

Primary Root Cause: Incident handling involves multiple activities and support teams, while classification, assignment, investigation, escalation, related changes, knowledge and SLA tracking must remain connected throughout the lifecycle.

Contributing Causes:

- Manual or inconsistent classification and assignment can delay routing.
- Relevant knowledge may require additional searching during investigation.
- Escalation and related records need coordinated tracking across teams.
- Resolution and cause information must be documented consistently for future reuse.

4. Available / Existing Solutions

Existing Capability	How It Addresses the Problem	Remaining Need
ServiceNow Incident Management	Provides a centralized incident record and lifecycle management.	Efficient classification, assignment and connected activities are still important.
Knowledge Management / Agent Assist	Provides relevant knowledge articles during incident handling.	Knowledge needs to be connected to the incident and reused effectively.
Change Management	Allows emergency changes to be created from incidents when required.	Related change activity should remain traceable with the incident.
SLA / Related Records	Provides visibility into SLA and associated records.	Teams need lifecycle-wide visibility rather than isolated records.

5. Proposed Solution Fit

Proposed Solution: Incident Lifecycle Automation using ServiceNow.

The solution fits the identified problem by connecting incident creation, classification, assignment, knowledge support, escalation, emergency change handling, child incidents, resolution documentation, knowledge creation and SLA tracking within the ServiceNow incident lifecycle.

6. Problem–Solution Fit

Problem	Solution Fit
Delayed or incorrect routing	Structured classification and assignment to appropriate support groups.
Difficulty accessing relevant guidance	Agent Assist and Knowledge Article integration.
Multi-team escalation	Reassignment and Level 2 support workflow.
Related change activity	Emergency Change Request creation and linked record tracking.
Recurring / related issues	Child Incident creation and tracking.
Incomplete resolution history	Probable cause, resolution code and resolution notes.
Loss of reusable resolution knowledge	Knowledge Article creation from resolved incidents.
Limited lifecycle visibility	SLA and related-record tracking.

7. Design Conclusion

The proposed ServiceNow solution aligns the identified user needs with the project capabilities and provides a connected approach to managing the incident lifecycle.
