

Requirement Analysis – 1. Customer Journey Map

Incident Lifecycle Automation using ServiceNow

Stage / Steps	Interactions	Goals & Motivation	Positive Moments	Negative Moments	Areas of Opportunity
1. Report Incident	Employee contacts Service Desk; agent creates incident.	Report the issue clearly and get help quickly.	Incident is recorded in one place.	Manual entry or incomplete information can slow handling.	Standardized incident creation and classification.
2. Classify & Assign	Agent sets category, subcategory, urgency, service and CI; assigns support group.	Send the incident to the right team quickly.	Clear classification and assignment improve routing.	Incorrect assignment can cause delays.	Automated classification, assignment and escalation.
3. Investigate	Support agent reviews details, knowledge articles and SLA information.	Identify the cause and resolve the issue.	Relevant Knowledge Articles can be attached to the incident.	Searching for information may take time.	Agent Assist and centralized knowledge integration.
4. Escalate / Change	Incident may be reassigned; emergency change can be created when required.	Coordinate Level 2 support and required changes.	Related records provide better traceability.	Multiple teams and records can be difficult to track.	Integrated incident, change and related-record tracking.
5. Resolve	Technician documents probable cause, resolution code and notes; incident is resolved.	Restore service and record a clear resolution.	Resolution details become reusable knowledge.	Poor documentation can reduce future reuse.	Structured resolution and knowledge creation.
6. Track & Close	SLA and related records are reviewed; final state is validated.	Maintain visibility and confirm lifecycle completion.	SLA tracking and linked records provide visibility.	Missed SLA or incomplete related records reduce visibility.	Dashboards, SLA monitoring and lifecycle validation.

Journey Insight: Support agents and employees need a centralized incident-management experience that reduces manual effort, improves routing and knowledge access, and provides visibility from incident creation through resolution and SLA tracking.
