

PERFORMANCE TESTING

Project: ServiceNow Incident Lifecycle Automation

Performance testing verifies that the Incident Lifecycle Automation solution performs reliably during normal and expected operational use. The testing focuses on the major incident-management activities included in the project.

1. Testing Objectives

- Verify that incident records can be created and updated without noticeable delay.
- Verify that incident classification and assignment activities work correctly.
- Verify that Knowledge Articles and Agent Assist information can be accessed during incident handling.
- Verify that related records such as change requests and child incidents can be created and tracked.
- Verify that SLA and related-record information is displayed correctly.
- Verify that the complete incident lifecycle can be completed from creation through resolution.

2. Performance Test Scenarios

- Create a new incident with caller, description, category, subcategory, urgency, service, and configuration item.
- Update incident assignment from Service Desk to the Network support group.
- Open Agent Assist and retrieve relevant Knowledge Articles.
- Open an incident and review Task SLAs and related records.
- Create or link an emergency change request from the incident.
- Create and track a child incident.
- Record probable cause and resolution information and resolve the incident.
- Create a Knowledge Article from a resolved incident and verify the related record.

3. Performance Checks

- Response time for opening and saving incident records.
- Response time for loading Agent Assist and Knowledge Articles.
- Time taken to update assignment and incident state.
- Time taken to display SLA and related-record information.
- Successful completion of change, child-incident, and knowledge-creation activities.
- System stability while executing the complete incident workflow.

4. Expected Result

The ServiceNow incident workflow should respond consistently and complete the defined activities successfully without functional interruption. Incident data, related records, SLA information, and resolution details should remain available throughout the lifecycle.

5. Performance Test Case Summary

Test Case	Activity	Expected Result
PT-01	Create and save incident	Incident is created and saved successfully.
PT-02	Classify and assign incident	Classification and assignment are updated successfully.
PT-03	Open Agent Assist	Relevant knowledge information loads successfully.
PT-04	Review SLA/related records	SLA and related records are displayed correctly.
PT-05	Create/link change request	Change activity is linked to the incident.
PT-06	Create child incident	Child incident is created and tracked.
PT-07	Resolve incident	Cause, resolution and incident state are updated successfully.
PT-08	Create Knowledge Article	Knowledge article is created and linked to the parent incident.
